# 1 Two enzyme kinetics: kinase-phosphatase

## 1.1 Equations

We obtain the equations as follows.

1. Calculate the six velocities of reaction:

$$\begin{aligned} & k_1 * s * e1 \\ & k_2 * e1s \\ & k_3 * e1s \\ & k_4 * p * e2 \\ & k_5 * e2p \\ & k_6 * e2p \end{aligned}$$

2. Assign derivatives with his sign: minus if arrow pointing from the molecule, plus if arrow pointing to molecule

$$\begin{aligned} k_1 * s * e1 &\rightarrow \{-ds/dt, -de1/dt, de1s/dt\} \\ k_2 * e1s &\rightarrow \{ds/dt, de1/dt, -de1s/dt\} \\ k_3 * e1s &\rightarrow \{-de1s/dt, de1/dt, dp/dt\} \\ k_4 * p * e2 &\rightarrow \{-dp/dt, -de2/dt, de2p/dt\} \\ k_5 * e2p &\rightarrow \{dp/dt, de2/dt, -de2p/dt\} \\ k_6 * e2p &\rightarrow \{dp/dt, de2/dt, -de2p/dt\} \end{aligned}$$

3. Reverse the assignments, from derivatives to reaction rates, adding in each diferencial equation, the rates with their sign. With this approach we construct the equations writing directly on method *modelkp\_6*.

```
dsdt = -k_1*s*e1 + k_2 * e1s + k_6 * e2p
de1dt = -k_1*s*e1 + k_2 * e1s + k_3 * e1s
de2dt = -k_4 * p * e2 + k_5 * e2p + k_6 * e2p
de1sdt = -k_3 * e1s + k_1*s*e1 - k_2 * e1s
de2pdt = -k_5 * e2p + k_4*p*e2 - k_6 * e2p
dpdt = k_3 * e1s - k_4*p*e2 + k_5 * e2p
```

### 1.3 Conservation of mass

Concentrations of enzymes  $e1$  and  $e2$  remain constant:

$$e1 = e1_0 - e1s$$

$$e2 = e2_0 - e2p$$

We write directly on the model method *modelkp\_4* both constraints, equating to zero the derivatives.

### 1.4 Numerical simulation *modelkp\_4*

Script 1.4.1 (python)

```

1 def modelkp_4(y, t, k_1, k_2, k_3, k_4, k_5, k_6, e1_0, e2_0):
2     [s, _, _, e1s, e2p, p] = y
3     # Constraints
4     e1 = e1_0 - e1s
5     e2 = e2_0 - e2p
6     dsdt = -k_1*s*e1 + k_2 * e1s + k_6 * e2p
7     de1dt = 0
8     de2dt = 0
9     de1sdt = -k_3 * e1s + k_1*s*e1 - k_2 * e1s
10    de2pdt = -k_5 * e2p + k_4*p*e2 - k_6 * e2p

```

```

11     dpdt = k_3 * e1s - k_4*p*e2 + k_5 * e2p
12
13     dydt = [dsdt, de1dt, de2dt, de1sdt, de2pdt, dpdt]
14     return dydt
15
16 # initial condition
17 y0 = [s_0, e1_0, e2_0, e1s_0, e2p_0, p_0]
18

21
22 # solve ODE

24
25 plt.figure(figsize=(15,10))
26
27 # plot results
28 plt.plot(t, y[:,0], label = "s")
29 plt.plot(t, y[:,1], label = "e1")
30 plt.plot(t, y[:,2], label = "e2")
31 plt.plot(t, y[:,3], label = "e1s")
32 plt.plot(t, y[:,4], label = "e2p")

34
35 plt.xlabel("Time [s] ")

## 1.5 Second constraint: Michaelis-Menten

$$\begin{aligned} de1s/dt &= 0 \\ de2p/dt &= 0 \end{aligned}$$

By imposing:

$$\begin{aligned} s * k_1 &\approx k_2 \gg k_3 \\ p * k_4 &\approx k_5 \gg k_6 \end{aligned}$$

We introduce directly the new constraint over *modelkp\_2* method.

## 1.6 Numerical simulation modelkp\_2

We saw that the plots pf product and substrate are not similar to previous ones.

## 1.7 Find parameters compatible with Michaelis Menten

$$s * k_1 \approx k_2 \gg k_3$$

$$p * k_4 \approx k_5 \gg k_6$$
